voltage produced alternately reverses from positive to negative polarity producing a corresponding change in the direction of current flow much like a dc generator an ac generator requires a coil to cut across the force lines of a magnetic field this coil is attached to two slip rings which deliver the current to and from the load destination thus completing the circuit alternating current generators are often called alternators the magnitude of ac voltage generated by an ac generator is dependent on 1 the strength of the magnetic field number of lines of force 2 the speed at which the loop rotates 3 the number of loops of wire that cut the magnetic field a rotation speed of 3000 revolutions per minute rpm produces 50 hz and 3600 rpm produce 60 hz the electric current in north american homes has a frequency of 60 hertz while in europe it is 50 hz an alternating current motor or ac motor uses electrical energy to produce motion and torque very simple ac motors are called squirrel cage motors these have only one or more stationary coils within which a special kind of mechanical rotor is free to rotate there is no electrical connection to the rotor from the outside most ac motors require a starter or method of limiting the inrush current to a reasonable level types of motor starting include reactive capacitor start and inductive start and electronic frequency drives and soft start drives the reactive start method is usually used on fractional horsepower motors and the electronic method is usually reserved for larger motors this 4 hr quick book 21 provides a basic understanding of ac motor and generator interconnection basics arb
