we respectfully submit these proceedings of the 1982 orbis scientiae for your reading enjoyment as always the success of the conference was due to the hard work and wisdom of the moderators and dissertators this year in addition to the excellent overview of qcd and gut and the customary reports of the latest progress in theoretical and experimental particle physics there have been discussions of new developments in astrophysics and especially of field theory and composite models we wish also to note here that the 1981 orbis paper by stephen s pinsky on death of fractional topological charge was actually co authored by william f palmer of ohio state university whose name was inadvertently omitted from the authorship due to a series of misunderstandings as in the past this orbis scientiae 1982 was supported on a small scale by the department of energy and this year as well by the national science foundation on the same scale we would like to thank mrs helga s billings for her excellent typing for the n th time where n is a large number this series of proceedings is also enhanced by linda scott s editorial help which includes improvements in the presentation of some of the papers

the standard model of elementary particle physics was tentatively outlined in the early 1970s the concepts of quarks leptons neutrinos gauge symmetries chiral interactions higgs boson strong force weak force and electromagnetism were all put together to form a unifying theory of elementary particles furthermore the model was developed within the context of relativistic quantum field theory making it compatible with all of the laws of einstein s special relativity the successes of the standard model over the years have been tremendous and enduring leading up to the recent discovery and continuing study of the higgs boson this book is a comprehensive and technical introduction to standard model physics martin and wells provide readers who have no prior knowledge of quantum field theory or particle physics a firm foundation into the fundamentals of both the emphasis is on obtaining practical knowledge of how to calculate cross sections and decay rates there is no better way to understand the necessary abstract knowledge and solidify its meaning than to learn how to apply it to the computation of observables that can be measured in a laboratory beginning graduate students both experimental and theoretical and advanced undergraduate students interested in particle physics will find this to be an ideal one semester textbook to begin their technical learning of elementary particle physics

In Quest of the Quark

2013-12

just before the preliminary program of orbis scientiae 1998 went to press the news in physics was suddenly dominated by the discovery that neutrinos are after all massive particles this was predicted by some physicists including Dr. Behram Kusunoglu who had a paper published on this subject in 1976 in the Physical Review. Massive neutrinos do not necessarily simplify the physics of elementary particles but they do give elementary particle physics a new direction. If the dark matter content of the universe turns out to consist of neutrinos the fact that they are massive should make an impact on cosmology. Some of the papers in this volume have attempted to provide answers to these questions. We have a long way to go before we find the real reasons for nature's creation of neutrinos. Another neutrino-related event was the passing of their discoverer, Fredrick Reines. The trustees of the Global Foundation members of the orbis scientiae 1998 dedicate this conference to Fredrick Reines of the University of California at Irvine. The late Professor Reines was a loyal and active member of these series of conferences on the frontiers of physics and cosmology since 1964. He also served as one of the trustees of the Global Foundation for the past three years. Professor Reines discovered the most elusive particle, the neutrino, in 1954. We are proud to say that we recognized the importance of this discovery by awarding him the
