from the preface the main objective of composting is to transform organic materials into a stable usable product often organic materials which may have limited beneficial use in their raw state or have regulatory disposal constraints can be transformed by composting into marketable products the limits on beneficial reuse may be regulations or they may be due to the potential for materials to be putrescible or pathogenic composting can be a solution for each of these the implementation of composting on a large scale in contrast to home or backyard composting involves materials handling technological implementation of composting must be consistent with the biological demand of the system if the biological system is violated conditions will not be optimized for composting and problems such as odor generation insufficient aeration or moisture or a combination of these conditions may result past problems and closure of facilities have been largely due to violations of the biological systems product quality with respect to particle size inclusions moisture content and other physical aspects are a function of engineering design a well designed system must have the biological and engineering principles in harmony at all times

the european union initially demonstrated its interest in waste in the late 70s with the programme on waste recycling research and development at that time composting was only present as a coordination activity and it was only later that specific research programmes in the area were within europe which was largely instrumental in setting up a series of european conferences seminars and work shops some of these have resulted in publications which have made significant contributions to developments in the understanding of composting and the use of composts in particular the outputs from meetings in oxford 1984 udine 1986 neresheim 1988 and angers 1991 are worthy of note composting has seen significant changes since the 70s when the major thrust in europe was using mixed municipal solid waste as a feed material many com posting plants which were built to use this material were closed due to the poor quality of the compost which made it very difficult to market as a result the main areas of interest as far as the municipalities are concerned are now with biowaste and source separated organics this interest is apparent from the many new plants which are being constructed across europe and the ready market which exists for the products in parallel with the renewed interest of the municipalities other areas such as agriculture and the wastewater treatment industries

are also developing their own schemes

leafing through my papers i came upon some notes on the history of composting which i have kept over the years and which are probably very incomplete but provide a brief insight into the history in germany cum grano salis besides the documents from east asia where composting is known to have been practiced for appr 4000 years these snippets encouraged me to sift through the literature to on the one hand confirm the many unverified statements and on the other hand seek the assistance of my colleague dr luis f diaz to help add further pieces to the mosaic numerous statements on composting in historical times can be found in the literature unfortunately in most cases without any indication of source we added to the following collection only those pieces of information that are verified by sources that we have read and can quote so if the observant reader has the impression that some information is missing that often appear in the introduction of publications on composting then this concerns those that we could not verify this is especially true for references to composting in china and in the orient as well as to vermicomposting in terms of literature composting is a top performer already in 1972 a list of the literature on waste management published in müllhandbuch waste manual by erich schmidt verlag included more than 1600 citations which is far more than any other area of waste management can offer i am not a slow reader but it is still not easy to obtain an overview due to the enormous amount of literature written on composting google returns appr 573 000 hits to the search word kompostierung german for composting the search word composting returns 17 000 000 sites on the internet compared to this the well known musicians the beatles look quite outdistanced with only 173 000 sites our own libraries comprise a humble 4000 articles and books on composting who then could still be able to keep track and even if many texts are merely quotations of earlier ones these have to be skimmed at least to find out if they contain new information or if they are only citations of earlier articles we hope that the reader will forgive us that in all probability we were able to consider only a small fraction the following is thus a journey through the literature of 4000 years and due to the abundance of information surely it is a mere extract without any claim on being complete
