people pursue their own interests whatever those interests might be some people have interests that are narrow and selfish while others have interests that are broad and altruistic the idea that people are self interested underpins all of economic analysis and raises two fundamental questions 1 how do

people choose the actions they think will further their own interests 2 can the potentially conflicting interests of different people be made to mesh in some sort of socio economic equilibrium this book is devoted to a detailed study of the first question its companion volume economy wide microeconomics equilibrium optimality applications and tests makes a detailed study of the second question following some foundational remarks this book studies the arrow debreu theory of consumer choice that theory supposes people choose so as to maximize a complete continuous transitive and reflexive binary preference relation over a non empty and compact choice set the book then studies numerous refinements generalizations and extensions of each of these restrictions up to and including recent work on behavioral theories of choice and choice behaviour when preferences are intransitive incomplete discontinuous also considered is choice behaviour in environments that are not necessarily compact a study is also made of intertemporal choice and choice under uncertainty the study of arrow debreu choice theory and its extensions are presented from the primal dual and revealed preference points of view consumers are not the only agents in the economy as producers are present as well beginning with a study of the arrow debreu idea that producers choose from a convex production set so as to maximize profit the book considers extensions and generalizations of this framework particularly to non convex environments the study is presented from the primal and dual points of view the final chapter in the book provides a link to its companion volume the chapter indicates how the theories of consumer and producer choice studied here help inform answers of the second question posed above resources are available to instructors who adopt this book more details at worldscientific.com/worldscibooks/10_1142_12789_sm

macroeconomic policy is one of the most important policy domains and the tools of macroeconomics are among the most valuable for policy makers yet there has been up to now a wide gulf between the level at which macroeconomics is taught at the undergraduate level and the level at which it is practiced at the same time doctoral level textbooks are usually not targeted at a policy audience making advanced macroeconomics less accessible to current and aspiring practitioners this book born out of the masters course the authors taught for many years at the harvard kennedy school fills this gap it introduces the tools of dynamic optimization in the context of economic growth and then applies them to a wide range of policy questions ranging from pensions consumption investment and finance to the most recent developments in fiscal and monetary policy it does so with the requisite rigor but also with a light touch and an unyielding focus on their application to policy making as befits the authors own practical experience advanced macroeconomics an easy guide is bound to become a great resource for graduate and advanced undergraduate students and practitioners alike

this book provides a comprehensive introduction to modern auction theory and its important new applications it is written by a leading economic theorist whose suggestions guided the creation of the new spectrum auction designs aimed at graduate students and professionals in economics the book gives the most up to date treatments of both traditional theories of optimal auctions and newer theories of multi unit auctions and package auctions and shows by example how these theories are used the analysis explores the limitations of prominent older designs such as the vickrey auction design and evaluates the practical responses to those limitations it explores the tension between the traditional theory of auctions with a fixed set of bidders in which the seller seeks to squeeze as much revenue as possible from the fixed set and the theory of auctions with endogenous entry in which bidder profits must be respected to encourage participation

this book combines practical guidance and theoretical background for analysts using empirical techniques in competition and antitrust investigations peter davis and eliana garcés show how to integrate empirical methods economic theory and broad evidence about industry in order to provide high quality robust empirical work that is tailored to the nature and quality of data available and that can withstand expert and judicial scrutiny davis and garcés describe the toolbox of empirical techniques currently available explain how to establish the weight of pieces of empirical work and make some new theoretical contributions the book consistently evaluates empirical techniques in light of the challenge faced by competition analysts and academics to provide evidence that can stand up to the review of experts and judges the book s integrated approach will help analysts clarify

the assumptions underlying pieces of empirical work evaluate those assumptions in light of industry knowledge and guide future work aimed at understanding whether the assumptions are valid throughout davis and garcés work to expand the common ground between practitioners and academics

antitrust law regulates economic activity but differs in its operation from what is traditionally considered regulation where regulation is often industry specific and involves the direct setting of prices product characteristics or entry antitrust law focuses more broadly on maintaining certain basic rules of competition in these lectures michael whinston offers an accessible and lucid account of the economics behind antitrust law looking at some of the most recent developments in antitrust economics and highlighting areas that require further research he focuses on three areas price fixing in which competitors agree to restrict output or raise price horizontal mergers in which competitors agree to merge their operations and exclusionary vertical contracts in which a competitor seeks to exclude a rival antitrust commentators widely regard the prohibition on price fixing as the most settled and economically sound area of antitrust whinston's discussion seeks to unsettle this view suggesting that some fundamental issues in this area are in fact not well understood in his discussion of horizontal mergers whinston describes the substantial advances in recent theoretical and empirical work and suggests fruitful directions for further research the complex area of exclusionary vertical

contracts is perhaps the most controversial in antitrust the influential chicago school cast doubt on arguments that vertical contracts could be profitably used to exclude rivals recent theoretical work to which whinston has made important contributions instead shows that such contracts can be profitable tools for exclusion whinston s discussion sheds light on the controversy in this area and the nature of those recent theoretical contributions sponsored by the universidad torcuato di tella

in his best selling irrational exuberance robert shiller cautioned that society s obsession with the stock market was fueling the volatility that has since made a roller coaster of the financial system less noted was shiller s admonition that our infatuation with the stock market distracts us from more durable economic prospects these lie in the hidden potential of real assets such as income from our livelihoods and homes but these ordinary riches so fundamental to our well being are increasingly exposed to the pervasive risks of a rapidly changing global economy this compelling and important new book presents a fresh vision for hedging risk and securing our economic future shiller describes six fundamental ideas for using modern information technology and advanced financial theory to temper basic risks that have been ignored by risk management institutions risks to the value of our jobs and our homes to the vitality of our communities and to the very stability of national economies informed by a comprehensive risk information database this new financial order would include global markets for trading risks and exploiting myriad new financial opportunities from inequality insurance to intergenerational social security just as developments in insuring risks to life health and

catastrophe have given us a quality of life unimaginable a century ago so shiller's plan for securing crucial assets promises to substantially enrich our condition once again providing an enormous service shiller gives us a powerful means to convert our ordinary riches into a level of economic security equity and growth never before seen and once again what robert shiller says should be read and heeded by anyone with a stake in the economy

most readers are familiar with the concept of a monopoly a monopolist is the only seller of a good or service for which there are not good substitutes economists and policy makers are concerned about

monopolies because they lead to higher prices and lower output the topic of this book is monopsony the economic condition in which there is one buyer of a good or service it is a common misunderstanding that if monopolists raise prices then monopsonists must lower them it is true that a monopsonist may force sellers to sell to them at lower prices but this does not mean consumers are better off as a result this book explains why monopsonists can be harmful and the way law has developed to respond to these harms
