Gas-Engine Principles 2018-01-14

excerpt from the practical gas and oil engine handbook a manual of useful information on the care maintenance and repair of gas and oil engines with special reference to the diesel oil engine actual horsepower the expression actual horsepower is equivalent to brake horsepower and is used to designate the power which an engine develops at the driving pulley the actual or brake horsepower of an engine is obtained by means of a prony brake or a dynamometer which gives the actual work or performance of the engine in foot pounds for any given length of time adjustment adjusting the parts of a gas engine is not generally as well understood as it might be it pays to take

time and do the work properly then it will not be necessary to tinker with one part or another when main bearings are loose the balance wheel will deflect as shown by the dotted lines j j which is a sure indication that bearings on the crank shaft are too loose and allow it to spring at every explosion this play around the crank shaft is shown at n in figure 1 p 10 the bearings have come loose and sometimes the result will be a broken shaft a crank bearing can be run very close if it is properly set up and all bolts firm otherwise it will run hot quickly about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks.com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy in rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition we do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

Gas-Engine Principles *2014-02*

excerpt from internal combustion engines and tractors their development design construction function and maintenance those of us who are familiar with the crude designs in which the internal combustion engine first appeared in the early nineties marvel at the progress that has since been made in refinement of design and the perfecting of mechanical efficiency although these engines twenty years ago were extremely uncertain in operation and control there were men who had faith enough in this type of motive power to continue its manufacture experimenting and improving until they developed the present excellent engines with which we are now so familiar the final result of this sifting out process is the development and specialization of different types designed to meet some particular need in some certain specialized field because of this specialization we have today the automobile engine the aeroplane the marine the stationary and the tractor engine each with its characteristic qualities and advantages for its special work another complication requiring more specialization arose just as the gasoline engine reached the point of development where it became a satisfactory power producer mechanically manufacturers found themselves

facing an entirely new problem an insufficient supply of gasoline which threatened to become a chronic condition in the fuel oil business this shortage of gasoline introduced a new stage in the development of the internal combustion motor an endeavor to produce an engine that would run with positive certainty and economy on the lower grade fuels such as kerosene and distillate the abundance and cheapness of which made them very desirable fuels this fact has had an important influence on farm engine and tractor designs the modern farm tractor of all the users of internal combustion engines the farmer had the greatest variety of work to be done as a consequence a large amount of capital has been invested to build engines to meet the farmers special demands the first farm engine was a small stationary engine usable for belt work only then a portable outfit was demanded and finally a self propelling vehicle to move itself from place to place thus the tractor industry came into being because of all the power needed by the farmer tractor power to take the place of animal power proved to be his most urgent need about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks.com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy in rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition we do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works
